

SOLAR HEATING

Would you buy a car without Air Conditioning?

Your pool is a valuable investment, so you will want to get the most enjoyment from it.

You may extend your swimming season at home by adding a solar heating system to your pool. This way the pool can stay at a constant temperature of approximately 26 degrees, the same temperature as the ocean at the Great Barrier Reef. *Tempting?*

By collecting and focussing the sun's warmth and energy, heating your pool can extend the swimming season by up to four extra months.

Because water holds its temperature, unlike the air, night swimming is ideal in solar-heated pools

Alpine Solar Systems work on a heat differential switch, which means the moment the roof is warmer than the pool it is automatically pumped to the solar collectors.

This takes full advantage of available temperature. This system is totally separate, therefore has no effect on required filtration.

Some valuable information about our 100% Australian owned Solar Heating Products that are included:

- **Solar Booster Pump.** Completely independent of your filtration equipment.
- **Digital Solar Controller.** All year round computerised control of your Solar Heating. Winter mode or Tropical mode it predicts the pool's temperature even while the pump is off.
- **100% Solar Matting Collector area.** Hydromatt HD is a black heavy duty 10 tube solar collector manufactured from the highest EPHL synthetic rubber. It has a demonstrated life of over 20 years with a 10 year warranty.
